

MaceStyle: Bringing It In-House

Running our Style Guide validator on Mace's own billing and governance

MaceStyle — the automated Style Guide validator already piloting on the Mace Way Control Centre — can run entirely on **Mace's own Azure billing and governance**, at **pennies per document**, with **zero code changes**. I've already proven the switch end-to-end. It needs a Mace Azure subscription to own it and a data-governance nod. Then it's roughly half a day to cut over.

What we have today

MaceStyle reads documents in the Mace Way Control Centre and checks them against the Writing Style Guide — British spelling, contractions, symbols, number and font standards — flagging issues and proposing corrections. It is **live in pilot**, validated by testers (Natasha, Jade) in June. The intelligent rules are powered by Claude, which handles the judgement calls a simple find-and-replace can't.

The catch: the AI currently runs on *my personal* Anthropic account and Azure subscription. That proves the concept — it's not how Mace should run a service it depends on. To make this a Mace service, the billing and governance need to sit inside Mace.

The proposal: run it on Mace's Azure, via Microsoft Foundry

Microsoft Foundry now offers Claude directly inside Azure. That changes the commercial picture entirely:

	TODAY (MY ACCOUNTS)	PROPOSED (MACE)
Who pays	Me, personally	Mace's existing Azure invoice
How	Separate Anthropic account	Azure Marketplace — a line on the bill we already pay
Governance	None to speak of	Entra ID, RBAC, data zone, spend caps
Procurement	—	None. No new vendor, no new contract

The key point: **no new supplier to onboard and no separate AI contract to negotiate**. Claude usage simply appears as consumption on the Azure agreement Mace already has. Microsoft handles billing and governance; Anthropic operates the model.

All billing stays inside Mace's Azure agreement — no separate Anthropic contract

How MaceStyle runs under Mace: the Function calls Claude via Foundry, and usage bills to Mace's Azure invoice.

What it costs

Consumption-based, and genuinely cheap at this scale. A document validation is a few thousand tokens of AI — **fractions of a penny to a couple of pence per document**. Even at hundreds of documents a day, this is a rounding error against the value of consistent, on-brand documentation across the Control Centre. No upfront commitment; Mace pays only for what it uses.

What I need from you

1. **A home for it** — nominate a Mace Azure subscription and cost centre to own the service. Mace already runs on Azure (the *mace365* tenant, Power Platform), so nothing new is stood up.
2. **A governance nod** — document text is processed by a US-hosted model. Foundry's US data zone and Azure governance are built for exactly this; it needs Sapna's sign-off, which I'll tee up.
3. **Half a day of my time** to cut over — I've already rehearsed the entire handover in a test environment, so this is execution, not discovery.

Why this matters beyond MaceStyle

MaceStyle is the **proof, not the point**. It shows a repeatable pattern: identify a real Mace problem, stand up an AI service to solve it, and hand it over running on Mace's own billing and governance — safely, cheaply, and without a procurement cycle.

That pattern is the AI Service Lead role in practice. Give me the mandate and MaceStyle becomes the **first of several** — each one an internal AI service that pays for itself in hours saved and lands inside Mace's existing Azure controls from day one.

Technical detail for whoever provisions it: see the companion *Foundry Handover Runbook*. · Stephen Cummins · AI Service Lead, Mace Digital · stephen.cummins@macegroup.com
